Plasma-Skin Tightening Aftercare

- Post treatment it is best to keep the treated area dry for 48 hours. After 48 hours only use Octenisept on the treated area. Pat dry, do not rub.
- Immediately after the treatment the skin may feel hot or a little stinging, with an array of small dots in the treatment area and some swelling will begin to manifest itself. An ice cube in a rubber glove covered in a dry cloth or tissue will ease the sensation.
- Sleep with an extra pillow, you should expect swelling in the treated area in the morning/s after the treatment. This will alleviate during the day once you are upright.
- Swelling could last 2 to 5 days on average.
- There will be several small crusts, which will last from 4 to 8 days, do not exfoliate these crusts, allow them to come off naturally. New 'baby pink skin' will appear under where the crusts were. Once crusts drop off naturally use vitamin A and E ointment if dry or itchy.
- Slight redness can last up to 8 days in some cases.
- If the treated area gets wet in the first 48 hours 'pat dry' with a clean towel. Do not have a sauna until the crusts have come off naturally.
- Please use SPF provided every day without fail.
- Please use mineral based make-up after 48 hrs if needed to cover the crusts.

- Do not undertake vigorous sweaty exercise for 48 hours after the treatment Please take regular photographs of your progress/healing.
- Please consult your practitioner regarding moisturiser.

It is important to follow the specific aftercare instructions provided to ensure the best possible healing and results. If you have any questions or concerns about the aftercare process, be sure to ask your practitioner for more guidance.
